Headcoach

Preflop Bible

The foundation of an elite poker player's game is his pre-flop strategy. We must first master pre-flop, before we can perfect our post-flop game.

Included in our pre-flop bible is a series of hand charts, mathematical calculations, game theory concepts, hand reading theory.

We also added deviations to the strategy in order to adapt to different opponents.

Once we have gone through all of this material, we will be ready to tackle almost any pre-flop spot!

Post-flop play, our mental game and development of so-called soft skills are more complicated and requires far more guidance and attention to detail.

See you at the tables!

OPEN RAISE

Out of position, it is extremely important to control the size of the pot. Which is why we recommend a small raise size.

Benefits:

- Lose less money when folding to a 3bet
- Keeping the pot small out of position
- Decrease our chance of losing a huge pot when calling a 3bet out of position
- Give ourselves a better price on a raise

Downsides:

- We will face more flat calls by in position.

NON-ANTE	
Position	Open raise size
Early position (EP) & Middle position (MP)	2.2 Big Blinds
Cut off (CO) & Button (BTN)	2.5 Big Blinds
Small Blind (SB)	3 Big Blinds

ANTE GAME	
Position	Open raise size
Early position (EP), Middle position (MP) & Cut off (CO)	2.5 Big Blinds
Button (BTN)	3 Big Blinds
Small Blind (SB)	3.4-3.6 Big Blinds (Pot sized open raise)
<i>In an ante game, we should use a slightly larger size, because there is more money to go after and we do not want our opponents to get a great price to enter the pot.</i>	
<i>We recommend not having a limping range from the Small Blind in order to avoid rake and exploit players' tendency of over folding their Big Blind to steals</i>	

RAISING VERSUS LIMPS	
	Open raise size
In Position	3.5 + 1 Big Blind per limper
Out of Position	4.5 +1 Big Blind per limper
Versus Small Blind Limp	3.5 Big Blinds

Strategy deviations

On tables on which our opponents often flat call we increase our open size to a minimum of 2.5bb on every position and slightly tighten our range.

When there are recreational players on the blinds, we do not use the standard raise sizes shown above.

We open bigger in order to extract more value versus the recreational player and to avoid flats from regulars.

Under the gun (UTG)

Reference

Standard opening range (17.4%, 230.2 combos)

Strategy deviations

We should decrease our Button open raise sizing when facing blinds who are not defending enough. Tight opponents generally pay too much attention to their own holdings and not their pot odds. We are giving a better price on a steal.

If the table is very tight, we can also decrease our raise sizing to a min-raise and open a wider range, since our opponents likely will not adjust by increasing their 3betting and/or flat calling ranges.

Small Blind (SB)

Limping on the Small Blind should be avoided below nl1000, because the rake is simply too high.

Reference

A2o	K2o	Q2o	J2o	T2o	92o	82o	72o	62o	52o	42o	32o	22

Strategy deviations

Many players over-fold their blinds to steals, which further incentivizes us to play a raise or fold strategy. It is essential that we adapt our strategy against different opponents. Every player has different leaks. Spotting them and making adjustments can boost our win rate significantly.

3BET

In position, we use a somewhat small 3bet sizing, to put Villain in a tough spot with his medium strength hands.

Villain will realize more equity in position, which means we should size up when 3betting out of position. Our range is slightly more polarized, since we are getting a good price to just call.

3bet sizes in bb at 100bb stacks 3betting by position (considering the opening sizes from above)

3BET	MP	CO	BTN	SB	BB
UTG	7	7	7	10.5	11.5
MP		7	7	10.5	11.5
CO			7	11.5	11.5
BTN				11.5	11.5
SB					9

3bet in position

We only flat call when there is a weaker player behind us since we want to play pots with him.

Do not be afraid to adjust our flat calling range, if there are extremely weak players behind us. They make much larger mistakes than the strong player we could be 3betting, which could make us a lot more money in the long run.

Button 3BET

There are merits on both parts for having a 3bet-or-fold strategy on the button, as well as a mix of flat calls and 3bets.

BluffTheSpot recommends playing a 3bet-or-fold strategy.

Benefits:

- Extremely difficult for the out of position player to play versus a high 3bet strategy.
- Prevent squeezes from the blinds.
- Prevent having a face-up and capped range when flat calling.
- Forcing the Cut Off to play a tighter range, which allows us to open raise more often (in order to steal the blinds).
- Pay less rake.
- Kicking the blinds out.

Downsides:

- We will be in larger pots with medium strength hands.
- Having to fold a few hands that would have shown a profit, compared to folding.

BluffTheSpot recommends only to play a flatting strategy when there is a recreational player behind us who we want to play against.

Another spot in which we can start developing a flatting range is when the blinds behind us are not squeezing a lot, and the original open-raiser used a small opening size. Generally speaking, the bigger the original open-raise size is, the more we want to avoid flatting and play a 3bet/fold strategy.

When playing a flatting range, our 3bet size for our 3betting range should increase 0.5-1bb.
 We only recommend playing a flatting strategy with a recreational player sitting in the blinds.
 How wide we want to flat depends on the opening size of the original raiser, on the likelihood that someone after us will squeeze and the skill level of the recreational player.

Small Blind Defense

BluffTheSpot recommends playing a 3bet-or-fold strategy, from the Small Blind.

Benefits:

- Increase the pot size with a strong range Pre-flop.
- Fold equity.
- Gaining the initiative.
- Kicking the big blind out.
- Not having a capped and face up flatting range.
- Pay less rake.
- Prevent squeezes from the big blind.

Downside:

- Having to fold a few hands that would have been profitable flat calls.
- We will have to play a few larger pots with medium strength hands.

Big Blind Defense

3betting a depolarized range

Defending the Big Blind is one of the most important aspects of the pre-flop game as it occurs extremely often. Which means it can make us win or lose a lot of money.

Benefits:

- Board coverage on middling boards.
- Having sufficient bluffs on high card boards, since most of our range smashes those boards.
- Pre-flop fold equity.
- Gaining the initiative.

Downsides:

- Increasing the size of the pot with a hand which is behind in equity.

The EV of 3betting suited connectors and suited Aces increases versus players who overfold to 3bets.

The EV of thin value 3bets goes down when our opponent folds more hands that we dominate. Inversely, we should 3bet big cards more thinly versus opponents who do not fold much against 3bets.

Strategy deviations

Versus someone who is over folding to 3bets, we can use a slightly smaller 3bet size.

Be careful that we do not size down too much, or else people could pick up on it and adjust. We include hands that we normally would have folded, and we can 3bet hands that would have been in our calling range against a standard opponent.

Against weaker players, we generally want to increase our 3bet size, since they call far too many 3bets, regardless of their pot odds.

Facing a bigger opening size (than the ones on the opening range section), we will adjust tightening our defending range.

4BET

First, we should determine our 4bet value range, then find an equal amount of bluffs.

We aim for a 1:1 ratio of value hand and 4bet bluffs.

Generally, we should 4bet hands that are slightly too weak to defend but have good blockers to our opponent's continuing range.

Criteria for 4bet bluffs

- Block Villains 5betting range
- Playability and board coverage
- Hands that are slightly too weak to call but a bit too strong to fold.

We should not 4bet too small and allow Villain to call 4bets with a wide range and have lots of playability.

Example K9s and ATo are good 4bet bluffs, in a Button versus Small Blind situation. K9s has one high card that removes some of our Villains continuing range, like AK and KQs, and we are suited. ATo has the Ace blocker, which blocks some hands like AA and AQs. We also dominate a few hands like T9s and 98s, that Villain could be calling a 4bet with.

4bet sizes in bb at 100bb stacks (considering 3bet size from above)

4BET	UTG	MP	CO	BTN	SB
UTG					
MP	20				
CO	20	20			
BTN	20	20	20		
SB	25	25	25	25	
BB	25	25	25	25	23

Defending versus 3BET

In position, we aim to defend 50% of our opening range, either by flat calling or 4betting.

Out of position, we only defend 45% of our range.

Being in position gives us a tactical advantage, but most players 3bet bigger while out of position, which means our pot odds will be worse.

Inversely, being out of position puts us at a tactical disadvantage, but our odds to continue will be better.

Strategy deviations

If someone 3bets very polarized, we can use a small 4bet size because they still cannot defend their weak hands, so they will often 5bet or fold.

When facing a more linear 3bet range, we have to use a larger size as the opponent has more equity and can call more 4bets.

Our 4bet range is polarized, which means we want to get maximum value when having a strong hand, and getting maximum fold equity when we do not.

Slow playing Aces and Kings pre-flop

Against most opponents, we should sometimes slow play Aces and Kings pre-flop versus a 4bet.

Slow playing these hands protects the weaker hands in our range and forces our opponent to proceed carefully in a 4bet pot. If our range is capped at a medium strength hand, our opponent can run us over with aggression.

We also keep all opponents' bluffs in the hand. Aces and Kings are so far ahead of our opponent's range, that we do not mind seeing a flop. If he hits any piece of the board, we will likely win his entire stack.

Slow playing Aces and Kings is not an exact science. The amount we want to slow play these hands depends on the pre-flop situation, our opponent, effective stacks and dynamics.

5BET

At 100bb effective stack our 5bet is going to be an all-in action forcing villain not only to fold all his bluffs but also to deny equity of the depolarized part of his 4betting range.

We 5bet most of our strongest hands and strong hands that need protection that often lose the pot when seeing a flop.

Criteria for 5bet bluffs

- Block Villains calling range.
- Aim to 5bet hands that are slightly too weak to call a 4bet but that will need to fold on the post-flop game (especially out of position).

Generally speaking, we rather 5bet shove OOP than IP as we realize more of our equity by shoving than by playing post-flop OOP.

Strategy deviations

On a deep stack game, we will need to make 5bets of 2.2x to 3x times the 4bet size. We do not want to go all in because the SPR (Stack-to-pot-ratio) is too high. We can start adding a non-all in 5bet at around 150bb+.

If our **villain does not 4bets often enough** we will need to tighten our 5bet range reducing our bluffs and calling our weakest value shoves.

Versus recreational players we can call more of our speculative hands because of our post-flop advantage.

Most recreational players also do not 4bet bluff much, which further disincentivizes a light stack off.

In pots where both players have extremely tight ranges, we can adjust by not having a 5bet range. Especially in player pools where most Villains do not 4bet bluff enough.

This simplifies our strategy and allows us to get away from our hand on unfavorable boards.

Middle Position (MP) versus Under the Gun (UTG)

Squeezing

Against tight flat calling strategies, we squeeze a fairly tight range. We mostly squeeze our premiums, but we also include some bluffs like suited Aces and Suited connectors.

Most strong regulars often play a 3bet or fold strategy pre-flop, so in most cases, when we see someone playing a high frequency flatting strategy, it is a recreational player.

Against a recreational player with a wide flat calling range, we squeeze a wide linear range to punish his loose flatting range, and to take advantage post-flop.

As there are many different types of recreational players, it is tough for us to give an exact chart for every possible situation.

To master this spot, we have to adjust and not only use charts. Understand different concepts which lead to different outputs and think outside the box.

Questions we should ask ourselves before squeezing:

- How wide does the recreational player flat?
- How likely is it that we get 4bet?
- How often will the open raiser fold to our squeeze?
- How often will the recreational player fold to our squeeze?

If it is unlikely we get 4bet by either player, we can squeeze a wider range, as we get to realize equity by seeing the flop.

As a rule of thumb for our squeeze sizing, we recommend something around:

- In position: Pot size - 1bb
- Out of position: Pot size +1bb

Playing against a recreational player, try to think outside the box and adapt our sizing on the spot. For example, we can squeeze much larger against a recreational player who plays a very wide range and still does not fold to squeezes.

Against a wide squeeze range, it is essential to develop a 4bet shoving range as the open raiser, to deny equity of the wide squeezing range. This exact range highly depends on the spot we are facing, but generally speaking the typical hand categories are strong high cards (like AK) and strong pocket pairs (like TT).

Squeeze vs Early Position (7.4%, 98 combos)

Deviation versus Early position & Squeeze versus Late Positions (2.9%, 38 combos)

Deviation versus Late Positions (2.9%, 39 combos)

General deviations

How to adapt to different raise sizes

- The smaller someone raises, the more we have to call, as our pot odds are better.
- Against larger open raises, we call less frequently and 3bet slightly more often.

Important factors when widening our opening range

- The big blind's fold to steal
- Our opening size
- Our opponent's 3betting frequencies (We can open more with tight 3bettors behind us)
- The Big Blind's post-flop skill level. (If the big blind is a recreational player, we want to play against him in position)

What about flat calling?

When the open raise sizing is smaller, we can flat more, as well when there is a fish in the blinds.

Changing our 3betting frequencies depends mostly on:

- Villains opening range.
- Villains open raise sizing.
- Villains fold to 3bet frequency (3bet more often if he over folds).
- When a recreational player open raises, we 3bet more because we want to isolate him.
- With recreational players behind us, we 3bet less often because we want to keep them in the pot, therefore we prefer a flatting range.

Folding to 3bets against players with tight 3betting ranges

We can over-fold to 3bets. Inversely, against loose players, we fold a bit less and also 4bet a wider range, both for value and as a bluff.

Trouble hands

Avoid high card hands that are easily dominated and focus on calling more suited connectors.

Statistical analysis

Our pre-flop ranges should be flexible, meaning we should adapt strategy from opponent to opponent. One of the best ways of gathering reads on our opponent's is HUD statistics.

Stats to pay attention to:

- Villains pre-flop raise first in (RFI).
- Villains 4bet range.
- Fold to 3bet (include separate stats for IP and OOP).
- Fold to flop c-bet.
- Flop c-bet frequency

Equity Realization ("R")

What is Equity Realization "R"?

This is a non-tangible concept, but there are a lot of variables that will make us have an approximation to "R"

Which factors are important for R?

- Rake (the higher the rake, the less equity we realize).
- Position (IP we will always realize more than OOP).
- Opponent and his strategy.
- Our hand
- Skill Advantage

How do we estimate "R"?

"R" is only important for borderline hands.

Let us assume we are defending the exact same range as the open raiser. We are out of position, which means we will realize less with our whole range. So, we can only realize around 85% of our equity of our whole range.

But our calling-range is wider than Villains opening range, that means that our average R will be even lower than 85%.

Furthermore, as there are strong hands which realize more than 100%, there also have to be borderline hands, which are below 85%

55-75% equity realization is more realistic for our borderline hands.

Fortunately, we live in a time with GTO Solvers and these solvers can estimate equity realization far more accurately than we can.

How to calculate "R"

"R" includes implied odds, reverse implied odds, playability, opponent, etc.

In order to defend our big blind profitably, we need to lose less than if we fold, which is 1bb.

Based on Villains open raise sizing and the pot size, we are going to calculate how much equity we need if we would realize 100% of our equity.

We use the formula $\rightarrow (\text{amount to call}) / (\text{pot} + \text{amount to call}) = \text{Equity needed to call}$

However, we will not realize 100% of our equity, therefore we have to estimate how much of our equity we are going to realize.

"R" = Equity Realization

D = Equity we have to realize to call

$$\text{Equity} \times \text{"R"} \geq D$$

When our **Equity** multiplied (×) by the **equity realization** is bigger or equal than the **equity we have to realize**, it means we can call our hand (it is still possible that a 3bet has a higher EV than calling)

Example We have **35%** equity against Villains range, but we only have to realize **28,6** equity.

How much equity do we have to realize? We separate R in order to make the math as shown on the right side,

Once we isolate "R" we can just divide D into Equity

We need to realize more than 82% of our equity, in order to call profitably.

$$\begin{aligned} 35 \times \text{"R"} &= 28,6 \\ \text{"R"} &= 28,6 \div 35 \\ \text{"R"} &= 0,82 \rightarrow 82\% \end{aligned}$$

Frequently asked questions (FAQ)

Why does the pre-flop bible not cover a Small Blind limping range?

Limping the Small Blind should generally be avoided below nl1000.

The majority of our opponent overfold their Big Blind to steals, so there is a greater incentive to play raise or fold. **For more information regarding Small Blind play, check out page 18.*

How does rake impact my game?

On almost all poker tables, the pots get raked once we go to the flop. Which means there is less incentive to see the flop.

Winning the pot pre-flop by 3betting, folding marginal hands in the big blind and not over calling too many marginal hands in position becomes very powerful in games with high rake.

How to adapt versus different opening and raises sizes?

When facing a different opening size that the ones recommended by BluffTheSpot we have to adapt our 3bet sizes.

As a rule of thumb, we can use as 3bet size:

- In position 3 times the original open raise size+1bb
- Out of position 4 times the original open raise size

How should we adapt versus different 3bet sizes?

We recommend 4betting to a minimum of 20bb.

A minimum of 2.5x Out of Position, sizing up to 3x when deeper.

In Position, we should 4bet smaller, to force Villain to call with a wide range. We recommend sizing up to 2.4x, and up to 3x when deeper.

What hands are we calling against 5bet shove?

When facing a 5bet shove we are defending with the value part of our 4betting range. This calling range will deviate on our villain's tendencies. We estimate Villains range and calculate the equity we need to call profitably.

Formula to calculate the equity needed

Break Even (equity needed) = **Risk** (amount to call) / (**Risk** (amount to call) + **Reward** (amount in the pot))

How do we defend the Big Blind when Button opens and Small Blind 3bet?

Generally, we do not recommend to ever cold-call a 3bet in any spot, as we end up in many tough spots with a “weak” face-up range.

By playing a linear cold-4bet or fold strategy, we avoid that scenario and generate fold equity. This is something which is even more important at lower stakes, as by taking down the pot pre-flop we avoid paying rake.

Standard cold 4bet size raise is between 2,25x -2,5x

We added this chart for reference.

Cold 4bet versus Tight Ranges (3.2%, 42.4 combos)
